New equipment for pressure welding
in magnetic forces field

ABSTRACT

Pipes pressure welding process using an electric rotating arc (ROTARC) for the ends of the parts' heating (usually pipes) is known, but a brief presentation is first given. The paper is presenting an original ROTARC portable equipment, pneumatically operated. This one has small dimensions, is friendly-use and easy operated and is an easy-transportable one. The equipment is destined for maximum 30 mm diameter pipes welding. Original pneumatic operating devices were designed, especially for high speed up-set. The magnetizing systems represent an original contribution, as too. Two pneumatically operated devices are included, in order to ensure a quick starting (in already pressured equipment) and a force amplifier mechanical device is described. Each coil of the magnetizing longitudinal two-coil system was designed in two-piece clamping device variant. Technical designing details, technological parameters used and experimental results are presented, as too.
